TickRefresh — Download

This indicator allows chart updates on each tick or price change with a user defined refresh time interval.

Settings:
Refresh Time Interval in Milliseconds = Number of milliseconds between chart refreshes.
Under "Set up > Calculate" choose between updates on each tick or each price price change.

Example values for Refresh Time Interval in Milliseconds:
0 = update on every tick or price change.
1 = maximum of 1000 updates per second.
10 = maximum of 100 updates per second.
20 = maximum of 50 updates per second.
100 = maximum of 10 updates per second.
The sane default is 10 milliseconds. But you can set it to 0 without issues.

See a demos here:
https://youtu.be/0sb8OANbcyo
https://youtu.be/O2bThPJBguU

Releases:
Version 1 March 25 2019: Initial release
Version 2 March 26 2019: Removed the TimerEventProcessor for better performance.
Version 3 March 28 2019: Optimized to prevent lag in fast markets if computer cannot keep up.
Version 4 April 4 2019: Improvements to latency and frame rate.

irReversalBarsV3 — Download

Updated previous version to correctly paint on top of other Paint Bar type indicators. March 26, 2019
Download link includes irReversalBarsV3
(for some reason the download link still refers to the previous "V2" version's name??)

This NT-8 indicator simply paints a Bullish Reversal bar or a Bearish Reversal bar on your candle stick or OHLC bar chart, it works on Hollow Candlestick charts also.

You might have to change the default color choices if you're using lighter colored chart backgrounds.

Indicator will color the candle bodies solid regardless of the direction they close in (up or down).
The indicator is set to calculate on bar close. (no need for it to be anything else)

Bullish Reversal condition: if((High[0] > Open[0] && Low[0] < Low[1]) && Close[0] > Open [0])
Bearish Reversal condition: if((High[0] > High[1] && Low[0] < Open[0]) && Close[0] < Open [0])

It's not the Holy Grail, but I find it helpful to have a visual clue that suggests "something may have changed here".

Enjoy,
Trade well.

EquitiesV2 Download

This version is identical in terms of functionality to version 1(which is located here: https://futures.io/local_links.php?action=ratelink&catid=27&linkid=1994).

I added the code (finally) to pull the expiry date from the chart and automatically add it to the indicator, so it no longer needs the user to manually input the date.

This indicator is for equities traders, to compare current performance with the 'other 3' equities and an average of all 4.

It adds data series for ES, NQ, RTY and YM, shows % change for each since the session open (24 hr session, not just the day session) as well as a simple moving average of all 4. The SMA period is user-configurable. Default is 10.

Hope you version 1 users find and download this one.

****
In reply to the comment about getting it to work in a strategy, I have never tried and am not a programming guru, but it seems likely that the 4 equity data series have to be loaded in the initializing sections of the strategy, which is before you call the indicator. The indicator can't load the data series for the strategy because it gets called after the strategy is initialized. That'd be my guess. That you have to load the 4 data series in the strategy itself for the indicator to access them when it's called.
Good luck!
****

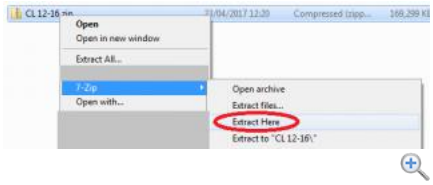
Great indicator broski.

Market Replay CL 03-19 (NT8) Download



NT 8 Market Replay data for CL

Contract: CL 03-19

Download instructions:

dowload and unzip file in NT 8 replay folder
Documents\NinjaTrader 8\db\replay
The file will create a folder with the relevant front month and a series of .nrd files inside (one per day)

Make sure to use the "extract here" function as shown, and not the "Extract to" function, to avoid the creation of a folder within a folder.

Note: the archive contains only the dates with the most volume for this contract, meaning, this is data relevant only to when the contract becomes the front month.

BuySellNetVolume-NT8_V1_21 (fpgBuySellNetVolume) Download

Winning Entry April 1st, 2019 to May 1st, 2019 [1 votes]

Notice: This indicator has been deprecated and will no longer supported as it has been replaced by Version 2 posted here

Updated Version 1.21 March 12, 2019

Exported with NT Version 8.0.17.2

Version 1.21 Corrections are described in Change Log

Previous Version 1.1 March 5, 2019
Exported with NT Version 8.0.17.1 (note this has been changed)

Notice(posted on 2/10/2019 at 1:45 PM MST)

It appears that something has changed in the latest NT update (8.0.17.1) that effected this indicator. The version here has been recompiled and re-exported using the latest release. No code changes were made. The version date (2/10/2019) and number (1.01) in the indicator parameters section reflect this change. If you have updated to the latest NT version and are having a problem or getting error messages either recompile the indicator or download and install the latest version.

I apologize for any confusion.

Summary

This indicator is an enhanced version of the NT8 BuySellVolume indicator. The enhancements are as follows:

- 1. Buys and Sells are show above and below the zero line,
- 2. The Net Volume (Buys-Sells) is plotted accordingly,

March 27th, 2019 10:42 PM **lager2**
This is great stuff. Thank you.

March 22nd, 2019 08:05 PM **skidmark**
Cheech

This is awsome! I use it on a 2700 tick NQ chart. I display it twice to see the overall

buy sell and (2) to zoom in on your EMA. Thanks for your hard work and your willingness t

March 6th, 2019 08:26 PM **bobc635**

- 3. Total volume is displayed using a separate color and is shown accordingly,
- 4. A divergence marker (Bar close is opposite the Net Volume) can be indicated (not enabled by default),
- 5. Tick Replay (TR) is supported and defaults to display a different color for the TR Net Volume bars,
- 6. The width of the Buy/Sell, total, and Net histogram bars can be set individually, and
- 7. Option to reverse the Histogram Buy/Sell and Net widths so that the Net bar displays on the inside of the Buys/Sell bar.

Notes:

1. At times the Net volume is so small it can not be seen with the indicator region parameter set in Linear Mode. This can be rectified by setting it to Log mode as shown in the screenshot.
2. When changing the histogram bar sizes use odd numbers as the bars are painted from the midpoints.
3. For a divergence to be detected in addition to the Net number and bar direction being opposite it must pass a percentage check. If too many (too few) divergences are detected the percentage can be changed to reduce (increase) the number detected.
4. When using the Tick Replay with a large number of historical days (Days to Load) there may be a delay in the time it takes to initialize.
5. The indicator is installed in a folder named "Cheech".

Version 1.1 Enhancements

1. Fast and Slow EMA of Net Buy and Sells with optional midrange which when set the period is the midpoint of the Fast/Slow period settings.
2. User defined volume offset from Zero line will create a Zero Zone with optional region painting.
3. Reorganized Indicator Parameters.

Version 1.1 Notes:

1. If EMAs are too close together set the indicator panel properties Type Parameter to Logarithmic
2. NT will display the upper and lower boundary lines (the zero zone) under the following conditions; 1. tick replay is enabled, 2. real time data is available (data feed is connected and market is opened), or, 3. the Zero Zone region painting is enabled. When any of the aforementioned are satisfied the lines will appear.

Version 1.21 Notes:
1. The labels of the MA plots were mis-labled as SMAs when they are actually EMAs.

Please PM me with either problems or questions instead of using the comments/rating section.

Change Log

Date	Description
2/2/2019	Initial release
2/10/2019	Recompiled and exported using NT 8.0.17.1
3/05/2019	Additional Enhancements described above
3/12/2019	Correct minor error in MA calculations, some code optimization, and Typos in Labels
4/13/2019	Deprecated, replaced by version 2

Thanks Cheech

Hourly Pivots (amaPivotsHourly) Download

Version 1.0 January 14, 2019

The **Hourly Pivots** indicator applies the calculation used for daily floor pivots to intraday time frames. The indicator displays pivots for any selectable period of N minutes. All pivots are calculated from the high, low and close of the prior N-minute period. The pivots can be displayed as floor pivots, wide pivots or Fibonacci pivots. The indicator further plots the pivot range, which is a value area derived from the prior N-minute period.

The default setting of the indicator is 60 minutes. With default settings the indicator will display hourly pivots including the Main Pivot PP, Central Pivot CP, Directional Pivot DP, Pivot Range, R1, R2, R3, R4 S1, S2, S3 and S4. The first period always starts with the daily session break. Depending on the period selected, the last period of the session may terminate before completion. It will not carry over to the first period of the next session.

Pivot range: The pivot range is the range between CP and DP. It is a symmetrical range around the main pivot PP.

Prior high, low and close: The indicator also displays the high, low and close for the prior N-minute period. These levels often act as support or resistance for the consecutive N-minute period.

Pivot formulas:

All options: H = prior day high, L = prior day low, C = prior day close, X = H - L
Main Pivot: P = (H+L+C)/3
Central Pivot: CP = (H+L)/2
Directional Pivot: DP = 2*P - CP
Floor Pivots: P = (H+L+C)/3, R1 = 2*P - L, S1 = 2*P - H, R2 = P + X, S2 = P - X, R3 = R1 + X, S3 = S1 - X, R4 = R3 + (P-L), S4 = S3 - (H-P)
Wide Pivots: P = (H+L+C)/3, R1 = 2*P - L, S1 = 2*P - H, R2 = P + X, S2 = P - X, R3 = R2 + X, S3 = S2 - X, R4 = R3 + X, S4 = S3 - X
Fibonacci Pivots: R1 = P + 0.382*X, S1 = P - 0.382*X, R2 = P + 0.618*X, S2 = P - 0.618*X, R3 = P + X, S3 = P - X, R4 = P + 1.382*X, S4 = P - 1.382*X

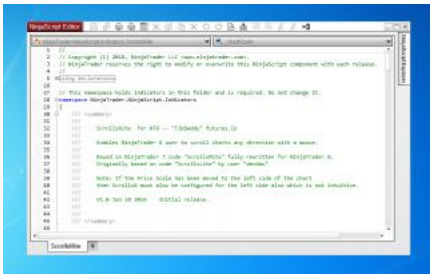
ScrollsRite for NinjaTrader 8 Download



This script installs as an indicator and allows users to drag their charts in any direction with a mouse. It is a feature of eSignal charting which I used for many years and simply could not live without when I moved to NinjaTrader. It is basically a rewrite of the NT7 version with the same name on this site and has been around for some time.

In truth NT8 provides this functionality already (by holding down the Ctrl key) but this indicator makes it that much easier by enabling it all the time.

I don't have much screen time last few years and I don't check in here that often but I will try and monitor for awhile to see that it works as expected. Leave comments in the original thread provided below.

Some Notes:

- If a chart has the Price Scale located on the Left side instead of the Right side of the chart as is normal, then you must configure ScrollsRite Scale Justification to the Left side also.

- To disable it temporarily simply uncheck the "Visible" checkbox in the ScrollsRite properties screen.

- If the Market suddenly shoots off the screen then hit the "F" icon at the top of the Price Scale to bring it back quickly.
