Twigg's Money Flow

[Download](#)

★★★★★

Colin Twigg's Money Flow indicator is similar to the Chaikin Money Flow (CMF). Where Chaikin Money Flow uses CLV (Close Location Value) to evaluate volume (money flow) as bullish or as bearish, Twigg's Money Flow, uses the TR (True Range). Twigg's Money Flow also relies on moving averages in its calculation while Chaikin uses cumulative volume.

Slow Relative Strength Index (amaSRSI)

[Download](#)

★★★★★

Version 1.2 November 25, 2017

The **Slow Relative Strength Index (SRSI)** is an oscillator which was presented by Vitali Apirine in the April 2015 issue of Stocks & Commodities.

The SRSI is a momentum oscillator derived from the RSI developed by Welles Wilder in 1978. Where the RSI takes into account price moves relative to the prior bar's close, the SRSI compares the current price to an exponential moving average. The SRSI uses the same scale as the RSI. A value above 80 is considered as overbought, whereas a value below 20 indicates an oversold condition.

Compared to the RSI, the SRSI is supposed to generate stronger long term signals, but weaker short term signals. I have added a signal line to the indicator.

Nota: I saw that another version of the SRSI has already been posted. That version is not adapted to work with bar types that support RemoveLastBar() such as Renko bars or Linebreak bars.

Nota: There is another version of the SRSI posted, which will not work correctly with bar types that support RemoveLastBar().

Ehlers Quotient Transform - Early Trend Detection

[Download](#)

★★★★★

The Quotient Transform which was presented in the August 2014 issue of the TASC magazine.

Ehlers Quotient Transform, which nonlinearly manipulates indicators to not only produce an early trend detection but also

Details: [Ehlers Quotient Transform - Early Trend](#)

provides the ability to know how long to stick with the trend. A typical characteristic of the early-onset trend detector is that it remains above zero, indicating an uptrend, far too long after the uptrend is over. This characteristic can be mitigated by adding an additional indicator and rule set to exit a long trend trade. The early-onset trend indicator can be tuned at the trader's preference by inputting a value for the low-pass period (LPPeriod) and the quotient parameter K.

The early-onset trend detector works in current market conditions because there is a decided upside bias to the market data. In fact, it is this upside bias that helps the nonlinear transfer response of the quotient transform work. In conditions where the market has a downside bias, negative values of K should be used in the quotient transform to take advantage of the bias in this direction.

[Slow Relative Strength Index](#)

The Slow Relative Strength Index (SRSI) is a price-following oscillator which was presented by Vitali Apirine in the April 2015 issue of the TASC magazine. It measures change in price movements relative to an exponential moving average (EMA). Like the relative strength index, it oscillates between zero and 100. SRSI is considered overbought when above 80 and oversold when below 20. SRSI can also generate signals by looking for divergences and centerline crossovers.

The SRSI is calculated using the following formula:

$$SRSI = 100 - [100 / (1 + SRS)]$$

$$SRS = \text{Average positive difference} / \text{Average negative difference}$$

The SRSI measures the strength of a security relative to a sixday EMA. The closing price is used for this EMA. The difference is positive when the close is above the six-day EMA. Positive difference = [Close - Moving average]. Difference is negative when the close is below the six-day EMA. Negative difference = [Moving average - Close]. Negative difference values are expressed as positive values, not negative values. If the closing price equals the six-day EMA, then difference = 0 (no change). Smooth positive and negative difference values are based on Wilder's smoothing technique.

[Wicks V1](#)

★★★★★

It's common for people to look at how large the upper or lower 'wicks' or 'shadows' are in comparison to the range of a bar. In writing strategies that do so, I got tired of re-re-coding calculations to look for especially large ones. So, I created an indicator that shows the upper and lower wick size as a percentage of the bar's range. So, now, if I want to specify a wick that's greater than 50% of the bar's range, I can just look for instances where the indicator values are UpperWick > 50 or LowerWick < -50.

If you find looking for negative numbers cumbersome, edit the indicator and reverse the LowerWick calculations, from either (Low[0] - Open[0]) or (Low[0] - Close[0]) to (Open[0] - Low[0]) or (Close[0] - Low[0]), respectively. Then, all the histogram bars will point upwards and you can make your code always look for positive values.

I hope some of you find this indicator handy.

Thanks go to jmont1, who graciously converted this indicator to NT8.

[TickBarsReassembled V0.1](#)

★★★★★

This is a first test of a TickBarChart style that will reassemble ticks at the same time and price into a single tick. This is really the same order but split up so it doesn't look like a big print.

I have only tested this chart on a ticksize of 1 (seems to make the most sense to me anyway) and putting it here for others to review.

You can see in the image the shaded area that combined all the ticks from the regular TickChart into a single tick. This is because all the ticks in the tape were at 18:37:43.093 with an open of 55.08. This was merged to a single tick of volume 20.

OrderFlow SnapShot (NT8)

[Download](#)

This is just a handy tool i made for myself and thought that maybe other traders will find it useful. As i am usually trading from charts but like to keep an eye on the orderflow, specially on areas of interest for entries or exits.

The indicator is just kind of a simple Footprint SnapShot, which can be toggled by double clicking on the chart. By holding the Control-Key while double clicking, the SnapShot will be reset.

Happy Trading,
Mike

(i am not planning to add anything else to this indicator but everybody is free to use and edit the provided code)
